

JavaScript

- 1) Create an object called person with properties for name, age, and gender. Assign appropriate values to these properties and log the object to the console.
- 2) Add a method called sayHello to the person object that logs a greeting message to the console using the person's name.
- 3) Update the age property of the person object to a new value and log the updated object to the console.
- 4) Write a program that equally distributes the number of balls to a number of participants.

For Example:

- Total number of balls: 19
- Total Participants: 7

Then, the number of balls (19 Balls) must be equally distributed to the number of participants (7 Participants) & the result must be:

- Equally distributed balls are 2 balls per participant.
- The remaining balls are 5 that are not distributed.

Please note that the number of balls must exceed or equal the number of participants.

- 5) Write a program to add the digits of a number and display the result. For example, 498 is a number and the programme must add the digits (4+9+8) and the output must be 'The Result is 21'.
