

1. Food_Delivery_Service
 2. Book_Inventory_Management
 3. Hotel_Management_System
 4. Task_Management_System
 5. Film_Rental_Store
 6. Hospital_Management_System
-

Please find the project tasks outlined below:

1. Backend Requirements

- The database schema has been provided.
 - Create and synchronize the given schemas within the Java application.
 - Develop the backend with proper API implementations, including:
 - POST API
 - PUT API
 - GET API
 - Ensure full database integration for all modules.
-

2. Frontend Requirements

- The team is requested to create the frontend pages for each module using Thymeleaf (as a separate Spring Boot application).
- The first page should be a static landing page containing images/icons representing:
 - POST
 - PUT
 - GET
 - ACTOR

Push the working backend and frontend code to the collaborated team GitHub repository.

3. Components involved:

- Backend server
 - Frontend server
 - Database server
-

Project Setup Requirements

1. Create a new Java Spring-boot application and add all required Maven dependencies in the pom.xml.
 2. Create entity classes based on the table structures provided in the SQL file.
 3. Based on the entity layer, create:
 - DTO classes
 - Repository interfaces
 - Service interfaces
 - Service implementation classes
 - Controller classes
 4. Update the application.properties file with:
 - The correct server port number
 - Database configuration, including schema, username, password, and connection settings
-

Collaborative Development Workflow (GitHub)

Day 1 Setup

1. The admin creates a new GitHub repository in internal mode (CG-L&D) and configures branch protection rules for the main branch.
2. The admin pushes the basic project structure to the repository.
3. All other team members pull the base project into their local environment.
4. Team members create their own feature branches and make code changes.
5. They then push their changes to their feature branches.
6. The admin reviews the changes and, upon approval, merges the pull requests into the main branch.

Daily Workflow (From Day 2 Onwards)

1. Each morning, team members pull the latest code from the main branch.
2. They work on their tasks within their individual feature branches.
3. By the end of the day, they push their updates to their respective branches.
4. The admin reviews and approves the pull requests and merges the changes into the main branch.
